

- ComputeScout

Find the best place on Earth to run your workload.

Infrastructure intelligence for GPU compute — not another AI chatbot.

BRIGHT DATA HACKATHON

BRIGHT DATA

GROQ

ML teams waste days choosing where to run GPU workloads.

- Fragmented market — RunPod, Vast, Nebius, Lambda, CoreWeave, and dozens more
- No single view of pricing, availability, reliability, and region fit
- AI chatbots guess from training data — they don't scrape live market prices

ComputeScout monitors the global compute market and recommends where to run.

COMPUTE ANALYSIS

Describe workload, budget, deadline, region
— get ranked recommendations.

GLOBAL RADAR

Bloomberg-style table of live GPU pricing
across all major providers.

PROVIDER INTEL

Health, availability, pricing, and market
summary per provider.

AI parses and explains. The engine decides.

— Scoring weights: price, availability, reliability, region

— Never let the LLM pick the provider

Live market data via Web Unlocker.

— **RunPod** — pricing page scrape

— **Nebius** — docs pricing scrape

— **Vast.ai** — marketplace JSON API

— **Lambda** — seed (JS-rendered, Phase 2)

HONEST LABELING

- **Live** = scraped via Bright Data right now
- **Seed** = estimated fallback data

Fast parsing. Clear explanations. Zero decision-making.

STEP 1 — PARSER

"Fine-tune Llama 70B in Europe under \$1000, 48 hours"

→ workload, model, budget, deadline, region

STEP 4 — NARRATOR

Human-readable explanation of the structured recommendation — not a chatbot conversation.

Europe → Nebius. US → RunPod. Same engine.

INPUT	RECOMMENDED	SCORE	COST	REGION
Fine-tune Llama 70B · Europe · \$1000 · 48h	Nebius	~89	~\$460	Europe
Fine-tune Llama 70B · US · \$1000 · 48h	RunPod	~89	~\$380	United States

Region weighting changes the winner — not AI guesswork.

One table. The entire GPU market.

PROVIDER	GPU	REGION	PRICE	SOURCE
RunPod	H100	US	\$1.99/hr	live
Nebius	H100	Europe	\$1.25/hr	live
Vast.ai	RTX 4090	Global	\$0.14/hr	live
CoreWeave	H100	US	\$2.69/hr	seed

From intelligence layer to ComputeOS.

NOW — MVP

Live pricing, deterministic recommendations,
global radar

PHASE 2–3

Availability alerts, Browser API, compute
procurement

PHASE 4–5

Cost optimization, workload routing,
ComputeOS
